Whirlpool ultimate care ii lid switch part number

"I love love love this app. It's so nice to have useful information (receipts, manuals, parts lists, warranty info, pictures, etc.) on all of my household appliances and devices in one place." The Whirlpool Ultimate Care II washer has a lid switch assembly installed inside the washer cabinet. When you shut the lid on the washer, a tab on the lid pushes down the switch to let the washer know it can fill with water, agitate and spin. Damaged to the switch caused by slamming the washer lid closed or damage to the switch's internal connectors can keep the washer from washing your clothes. A damaged switch could even keep the washer from draining. Reach behind the Whirlpool Ultimate Care II washer to pull the washer's power supply cord from the wall outlet. Slide the washer forward about six inches. Look behind the control panel for the two screws at each end of the panel. The screws set in channels at in the ends of the panel. Use a magnetized-tip Phillips screwdriver to remove the screws so you can lift the screws from the channels. Pull up on the front of the control panel. Rotate it over the back of the Whirlpool washer to expose the spring clips holding the washer's cabinet to the rear cabinet wall and the lid switch wire harness. Push the end of a flat-head screwdriver into the hole in the cabinet holding the spring clips. Continue to push the end of the screwdriver down while pushing the handle of the screwdriver toward the rear cabinet wall. This pops the springs from the top of the Whirlpool washer's cabinet. Grab the wire harness with your fingers and pull it from the connector on the lid switch. Spread an old blanket over the floor. Grab both sides of the Whirlpool Ultimate Care II cabinet. Tilt the cabinet forward and slide it off the bottom support frame. Lay the front of the cabinet on the old blanket. Look beneath the lid for a green ground wire attached to the washer cabinet. Remove the screw holding the green wire to the cabinet. Place the screw in a safe location. Open the lid and look for the two screws next to the lid switch opening. Remove the two screws holding the screws. Place the lid switch screws in a safe location. Unsnap the wires attached to the lid switch from the metal retainers along the edge of the cabinet. Use pliers to squeeze the side tabs on the lid switch connector to release it from the hole in the cabinet. Discard the old lid switch. Snap the new lid switch connector into the opening in the cabinet. Secure the lid-switch wires beneath the metal retainers along the edge of the cabinet. Hold the new switch against the cabinet while you secure it with the lid switch screws. Use the screw you removed from the green ground wire to secure the new ground wire to the washer cabinet. Reverse the steps you used when disassembling the Whirlpool Ultimate Care II washer to reassemble it. Push the washer back in its original position and plug it back into the wall outlet. Activate and hold the button to confirm that you're human. Thank You! Try a different method Washer wouldn't run I removed the two screws on the back of the control panel. The control panel then flips back. The switch is on the left side. To remove the switch, I first detached the wire to the control panel and unscrewed the grounding wire. The new switch drops right in. I had a little trouble getting it in until I realized the washer lid had to be open. A little awkward but once it's in you can shut the lid and then I reattached the wire from the control panel and screwed in the grounding wire. Pretty easy. \$20 for the part (with shipping) and 15 minutes. Way cheaper than a repairman. Clint from Kansas City, KS Really Easy Less than 15 mins Screw drivers, Socket set 304 of 338 people found this instruction helpful. Thank you for voting! washer would not run First, I removed the two screws that hold the back-top in place. I removed the top to get to the control timer. I replaced the control timer with a new part and replaced the lid switch (which I broke removing the old one). Put it all back together and still nothing. I removed the two spring U clamps at the top back that hold the entire casing in place. I removed the casing. I checked out the wires leading to the motor and the white wire showed signs of a burn. When touching this wire it broke off. I used a pigtail from the connector to the old wire, soldered it in place and put it all back together AND, WOW, LUCKY ME it has been working since. The parts I ordered on Monday, came to my house the next day and I did not pay for additional shipping. I returned the timer and the \$ was credited to my account in about one week. Partselect is about the best experience I have had on the internet. Other Parts Used: Martin from Cleveland, TN A Bit Difficult More than 2 hours Nutdriver, Pliers, Screw drivers 92 of 115 people found this instruction helpful. Thank you for voting! Lid Switch Failed - Machine Filled but Stopped I bought the manual and the switch. I found the manual to be rather generic version that caused problems from the start because the screws to remove the control panel were not in the location shown. Once I had the machine disassembled, removing and replacing the switch was a very simple task. I took time to clean inside the cabinet. That took an extra few minutes. If I had to do this job again today, it could be done in less than 30 minutes. Note: there was a sheet metal screw on the back of the cabinet, left side, near bottom This screw was also not noted in the manual and when I pulled the cabinet forward, the screw was torn out and the cabinet bent slightly. No major damage, Other Parts Used: GEORGE from VACAVILLE, CA 30 - 60 mins Nutdriver, Screw drivers 79 of 109 people found this instruction helpful. Thank you for voting! Lid switch stopped workin Unplug washing machine from electrical outlet. Remove two screws that go at a 45 degree angle into the top of washer from behind control panel. Pull panel console towards you and then up, unplug lid switch from wire harness. It's in upper left corner of the washer. A little awkward but lid must be open. pull switch up from top of washer, insert new one, it just clips in, then plug back into harness. Re mount control console and you are done. Really Easy Less than 15 mins Nutdriver, Screw drivers 55 of 65 people found this instruction helpful. Thank you for voting! Washer full of water, wouldn't cycle Although your website mentioned removing 2 screws to open the control panel, it took a while to realize there were 2 screws and 2 hex nut screws to open it followed by 15 minutes of efforts to release the control panel from the top of the washer by sliding it forward. After that it took 2 minutes to replace the switch; the web comment of keeping the lid open was helpful. Unfortunately, the lid switch was not the problem; replacing the timer did the trick, was very easy with the control panel already opened and required the purchase of 1/4 and 3/16 hex nut drivers. Parts, shipping and tools cost \$110 but the success of the repair with your parts and advice was priceless. A Bit Difficult 1- 2 hours Nutdriver, Screw drivers 32 of 37 people found this instruction helpful. Thank you for voting! Washer machine wouldn't start First I removed the two screws holding the main controller located on the back. I then slide forward the hole controller and I pulled out. Disconnected switch located on your left. (remember to place down washing machine lid before installing the new switch.) Pedro from Riviera Beach, FL Really Easy Less than 15 mins 27 of 32 people found this instruction helpful. Thank you for voting! Washer lid switch worked sometime, sometime not First, I'm so excited that this site exists because I knew that the problem was minor and I didn't want to pay the outrageous housecall price of a repairman. I read other customers' experiences on how they fixed the problem and that made it sooo easy! Basically unscrewed the screws on the far left and right on the top panel, folded it down toward front, unscrewed and unplugged the ground wire and replaced the part. Someone else had warned that the lid should be open to remove it and that was a huge time-saver. Thanks so much! The part was broken because of very poor design. The part actually worked fine, but the piece of thin plastic that held the part in place broke. Back to the drawing board Whirlpool. Really Easy 15 - 30 mins Screw drivers, Wrench (Adjustable) 22 of 24 people found this instruction helpful. Thank you for voting! stopped working only filled with water. Fast simple and supper easy! Please do not wait your time or money on repairmen that rip you off. You are guaranteed all the way or your money back from Parts Select. Go to your model number than read a few stories of others to better pin point your problem then order part and your item will ship fast. I had my part on the 2nd day of the order. Do not be fooled you can do it easily! I have order twice and both items went smoothly and took less then 10 minutes to put in. Thanks Parts Select for making it possible for the little guys and supporting them and not the big rip off scammers. I will be back when needed. May you continue in your good deed! C.S. Christa J from Eldorado Springs, MO Really Easy Less than 15 mins 19 of 23 people found this instruction helpful. Thank you for voting! washer wouldn't start up after filling & closing lid First I loosened the 2 screws on the outside of the top control assembly with a philips screwdriver. Then I took out the 2 other screws toward the top on the back with a socketwrench.Next I removed the top so I could access the switch. After that I removed the broken switch and unhooked from wire hareness. I then hooked up the new switch and snapped into place. Last I put the top back on and screwed into place. 15 - 30 mins Screw drivers, Socket set 19 of 23 people found this instruction helpful. Thank you for voting! My washer stopped mid-cycle and acted completely dead I thought the click of the lid switch sounded different so I pulled the top console and tested it for continuity in both positions and found none. When I by-passed the switch the washer started up, so I knew what the problem was. There are four screws involved to remove the console which reveals the lid switch to the left side. There's a single screw for a ground wire but the switch itself is simply snapped in place after disconnecting the wire harness plug (must be done with the lid open btw).I was lucky to diagnose the problem accurately so that the first thing I suspected turned out to be the problem! Really Easy Less than 15 mins Nutdriver, Screw drivers 18 of 19 people found this instruction helpful. Thank you for voting!
